

HCI: controls and feedback help users

01 Activity statistics

Distance, time and elevation gain summarize the recorded activity. Clear labels and large values make the results easy to scan.

02 Play button

The familiar triangle signals playback. It gives users a direct way to start viewing their route animation.

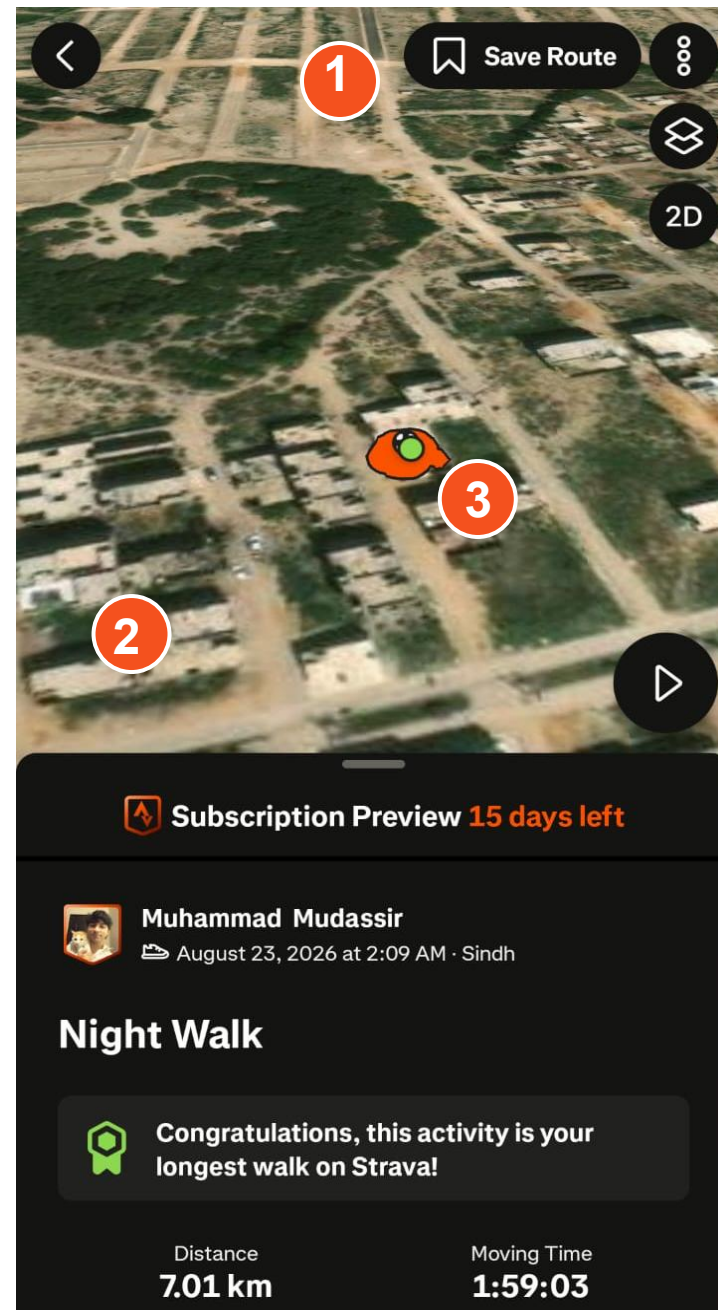

03 Labeled bottom navigation

Home, Maps, Record, Groups and You provide clear destinations. The highlighted Home tab shows the current location.

REFLECTION 1 / ONE HCI IMPROVEMENT

I would add a “Play route” label beside the play icon so new users can understand the action before tapping.

CG: an angled map communicates space

01 Perspective camera

The tilted view shows the map receding into the distance. Distant roads and blocks appear smaller, creating a sense of depth.

02 Satellite surface texture

Aerial imagery supplies visible roads, rooftops and trees on the map surface. These details help users recognize real locations.

03 Depth cue: overlap

The orange route marker is drawn over the map and hides the imagery beneath it. This foreground overlap separates the route from the ground.

REFLECTION 2 / GRAPHICS AND USABILITY

The angled view and satellite detail help users relate their route to nearby landmarks. Blurry imagery or a steep camera angle can make small features harder to identify.
